# **Panduan Konfigurasi Pencadangan Awal**

**Versi 5.8.7 R1**

## Catatan Perubahan

Tanggal	Deskripsi Perubahan
02 Mei 2020	Versi 5.8.7 R1 Rilis Dokumen

# **DAFTAR ISI**

Bab 1 Latar belakang .....	4
1.1 Definisi.....	4
1.2 Skenario .....	4
Bab 2 Konfigurasi .....	5
2.1 Ekspor Cadangan Awal .....	5
2.2 Impor Cadangan Awal.....	8
Bab 3 Pencegahan.....	10

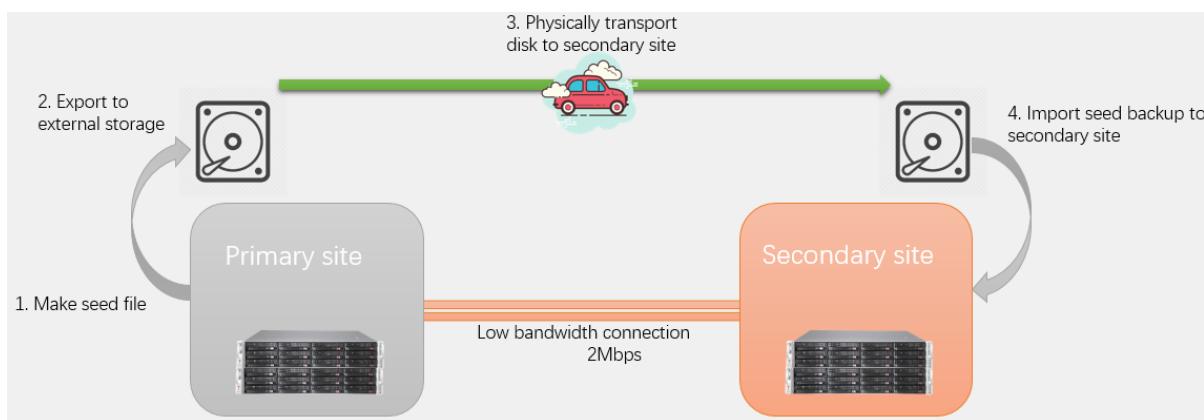

# Bab 1 Latar belakang

## 1.1 Definisi

- Fitur pelengkap untuk skenario DR di luar situs
- Ganti transfer data berbasis jaringan dengan transportasi media penyimpanan
- Replikasi offline
- Target Pelanggan
  - ✓ Di luar situs DR
  - ✓ Koneksi bandwidth terbatas antara 2 situs
  - ✓ Cadangan pertama kali terlalu besar
  - ✓ Transfer data berlangsung selamanya melalui jaringan

## 1.2 Skenario

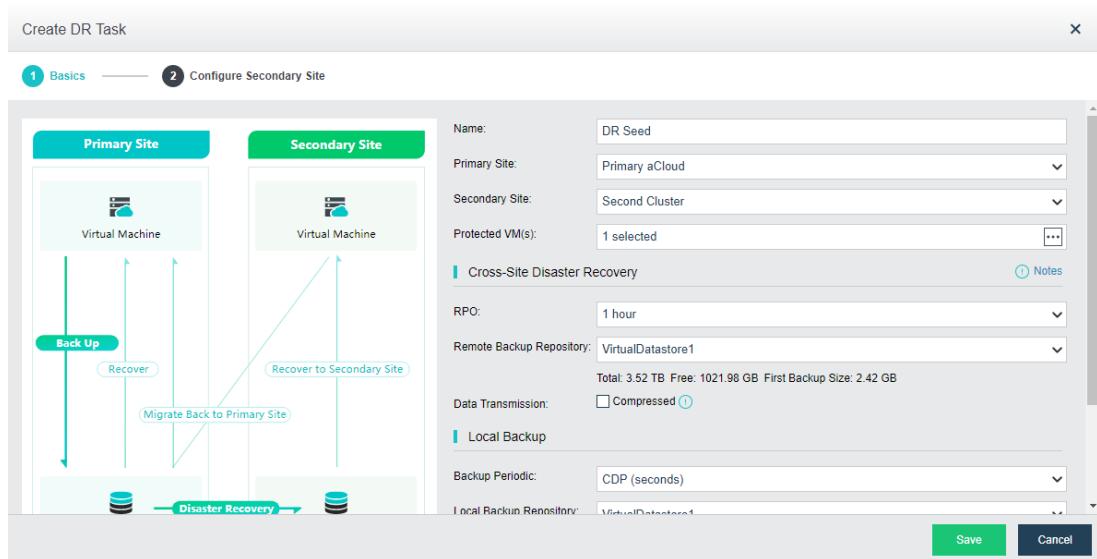

Pelanggan memiliki situs primer dan sekunder dengan rencana DR. Namun, bandwidth antara 2 situs sangat sempit (2Mbps, kecepatan maksimum 256KB/s). Asumsikan ukuran cadangan pertama pelanggan sekitar 2TB, dibutuhkan sekitar 48,5 hari untuk mentransfer cadangan ke situs sekunder. Kita bisa menggunakan cadangan awal berfungsi untuk mengatasi keadaan ini. Eksport cadangan VM ke media penyimpanan eksternal dan fisik mengangkut disk ke situs lain. Setelah mengangkut cadangan pertama, cadangan tambahan yang lebih kecil dapat diangkut melalui koneksi jaringan.

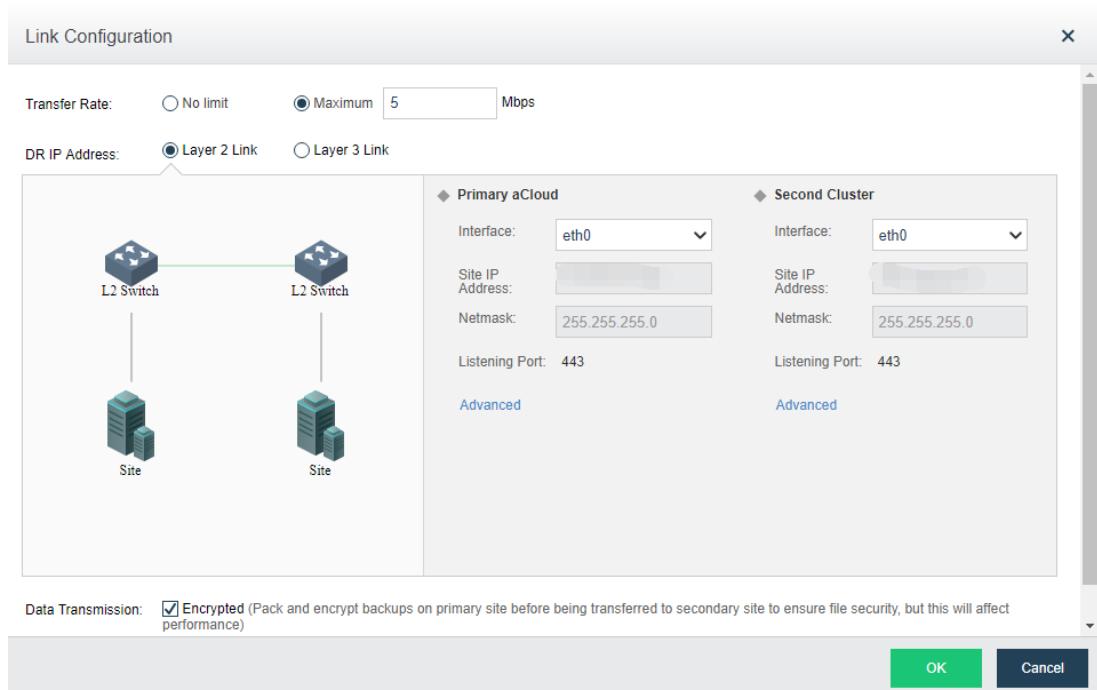

# Bab 2 Konfigurasi

## 2.1 Eksport Cadangan Awal

### 1. Konfigurasikan kebijakan Tugas DR

### 2. Manajemen tautan dibatasi hingga 5 Mbps

### 3. Setelah menjalankan tugas DR, pastikan cadangan situs utama telah dibuat.

4. Colokkan HDD USB atau HDD server ke kluster utama aCloud (server apa pun). Buat penyimpanan local di bawah "Storage > Other Storage > New > Local Storage"

Tambahkan penyimpanan lokal ke repositori cadangan

5. Pergi ke "Disaster Recovery > Replica Seeds > Create Replica Seeds"

Pilih DR Task dan VM yang ingin diekspor sebagai cadangan awal.

6. Pilih repositori cadangan lokal dan klik mulai untuk melanjutkan eksport.

7. Tunggu proses eksport selesai.

8. Setelah ekspor selesai, cabut disk lokal dan pindah ke situs sekunder lain.

## 2.2 Impor Cadangan Awal

1. Colokkan HDD USB atau HDD server ke kluster sekunder aCloud (server apa pun).

Buat penyimpanan lokal di bawah "Storage > Other Storage > New > Local Storage"

The screenshot shows the Sangfor Cloud Management interface. On the left, there's a navigation bar with tabs: Summary, Virtual Storage, and Other Datastores. The Other Datastores tab is active. Below the tabs, there are buttons for Refresh, Update, Scan for New Disks, and a New button, which is highlighted with a red box. The main area shows a table with columns: Status, Name, Storage Type, Total Capacity, Available Space, and Peak Read Speed. On the right, a modal window titled 'Add New Datastore' is open. It has a 'Storage Type:' section with radio buttons for iSCSI, FC, and Local storage, with Local storage selected. Below this is a table with columns: Status, Disk, Node, Size, and Details. A single disk entry is listed: INTEL SSDSC2KG48\_ATA\_355cd2e41..., Node 192.168.20.37, Size 447.13 GB, and a 'View' link. At the bottom of the modal, there's a question 'How to add a new local disk?' and 'Next' and 'Cancel' buttons.

2. Tambahkan penyimpanan lokal ke repositori cadangan juga.

Add New Datastore

Datastore:	Local-storage		
Description:			
Connect To Node			
<input type="checkbox"/> Node Name	IP		
<input checked="" type="checkbox"/> 192.168.20.37	192.168.20.37		
<input type="checkbox"/> Recover existing virtual machines on this datastore as well <input checked="" type="checkbox"/> Add this datastore to VM backup repositories as well Max Backup Repository/Total Capacity: <input type="text" value="100"/> % <a href="#">Details</a>			
2/2	Back	OK	Cancel

### 3. Masuk ke "Disaster Recovery > Replica Seeds > Import Replica Seeds"

### 4. Pilih kluster situs sekunder dan penyimpanan lokal, dan pilih nama VM yang diekspor. Klik Berikutnya untuk memulai impor.

1

Select VM

Site: <input type="text" value="Second Cluster"/>	Datastore of Replica Seeds: <input type="text" value="Local-storage"/>		
Select Replica Seed File of VM:			
<input checked="" type="checkbox"/> VM Name	Max File Size	DR Task	Time Created
<input checked="" type="checkbox"/> NV-Licserver-5.1-20180829	1.99 GB	DR Seed	2019-07-12 19:48:39

! Please mount the datastore (where the replica seed file is located) to the secondary site, since the replica seed file on the primary and secondary sites is inconsistent and cannot be selected

### 5. Klik pada tugas/task untuk memeriksa kemajuan impor.

4%	Import replica se...	NV-Licserver-5.1...	2019-07-12 20:09:56	-	admin (192.200.19.90)	<a href="#">View</a>	<a href="#">Cancel</a>

Completed	Create disaster	Description: -				<a href="#">View</a>	
Completed	Delete disaster					<a href="#">View</a>	

6. Setelah pengimporan selesai, akan muncul cadangan di sisi sekunder.

Protected VMs	Unsynced Data Size	Backups	Total Size	Last Backup	Priority
NV-Licserver-5.1.0...	-	1	2 GB	2019-07-12 09:45:18	Medium

## Bab 3 Pencegahan

1. Saat mengekspor file cadangan awal, sistem akan secara otomatis melakukan pencadangan penuh di virtual mesin, untuk memastikan data cadangan adalah yang terbaru.
2. Saat mengimpor file cadangan awal, sistem akan secara otomatis membatalkan transmisi cadangan terbaru tugas dan melakukan impor VM ke tugas.
3. Setelah cadangan awal diekspor, seharusnya tidak ada cadangan tambahan lain di situs utama, selain itu tidak akan dapat mengimpor di situs sekunder karena tautan cadangan tidak valid.
4. Dengan kata lain, jika gambar cadangan berhasil ditransfer ke situs sekunder, itu tidak akan dapat dipulihkan juga karena cadangan ada.
