5.1 Through the authentication policy.....	2
5.2 Implement through Creating Local User Manually	3
5.3 Binding Mac When AF Connects to Layer 3 Switch.....	5
6. Precautions	6

1. Function Introduction

Describes how to set user binding IP or MAC address.

2. Application Scenarios

Configure user binding IP or MAC address, and configure configuration to let users who already bind with IP or MAC address are allow to access internet.

Bind the MAC address when the NGAF device is connected to the Layer 3 switch.

3. Description of Necessary Conditions

1. One NGAF device and one PC.
2. Deploy the network environment to ensure that the PC can access the NGAF device, and ensure that the data of the test PC will pass through NGAF.
3. If the intranet user is bind to the MAC address and the NGAF device is connected to the Layer 3 switch, you need to configure the Obtain MAC by SNMP on the NGAF.

4. Configuration Ideas

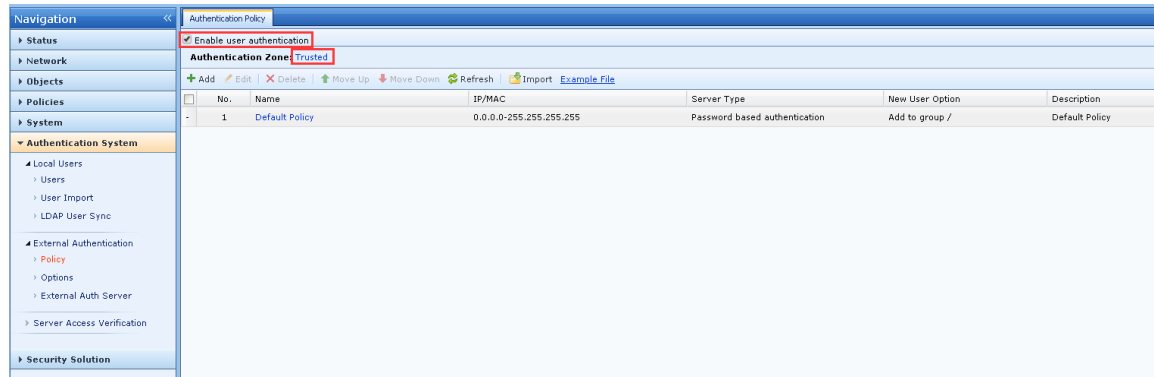

1. User who bind through an authentication policy can access to Internet.
2. Users who implement binding by manually creating local users can access the Internet.

5. Configuration Mode and Screenshot

This requirement can be achieved by two methods, the specific configuration is as below:

5.1 Through the authentication policy

Go to **Authentication System > External Authentication > Policy**, then enable the **Enable user authentication** and choose the authentication zone:

2. Click on the **Add** button, then configure as figure below:

Authentication Policy

Name: Authentication

Description:

IP/MAC Range: 192.168.1.0/24

Server Type

☒ None/SSO *This can follow customer requirement*

☐ Take IP as username

☐ Take MAC as username

☐ Take host name as username

If SSO is configured, the detected username is preferable

☐ SSO, Local or external password authentication ⓘ

The browser will be redirected to an authentication page when user attempts to access the Internet, on which user credential are required. Configure External Auth Server

☐ SSO only ⓘ

Excluded Users: Login name (comma-separated)

New User Option (for users outside local device)

☒ Added to specified local group

Select Group: / ⓘ

☐ Not applied to new users authenticated against external LDAP server (for they can be synchronized to a corresponding group automatically).

User Sync Policy:

Other User Attributes:

Concurrent Login: ⓘ

☐ Allow concurrent login on multiple terminals

☐ Only allow login on one terminal

☒ Bind IP/MAC: Binding Mode *This is to specific the relationship*

☐ Bind the IP on initial logon

☐ Bind the MAC on initial logon

☐ Bind the IP and MAC on initial logon

☐ Added as casual account (not to any local group), with same privilege as

User Group: / ⓘ

☐ No authentication for new users

OK Cancel

3. After configured step 1 & 2, authenticated users will automatically added to Default group (it can choose to add to another group). Go to **Authentication System > Users** to check added users. If the user in **Users** is identified as a local user, the user who is not in **Users** will be recognized as a new user when accessing the Internet next time.

4. Then need to wait user completes the authentication, and after the corresponding binding relationship exists in the **Users**, modify the authentication policy, change the **New User Option** to **No authentication for new users**. User under local organizational structure when matching authentication policies will not recognized as new users. When new users go online, they will match **No authentication for new users**.

5.2 Implement through Creating Local User Manually

1. Go to **Authentication System > Users**, manually add groups and users and set the binding relationship as below:

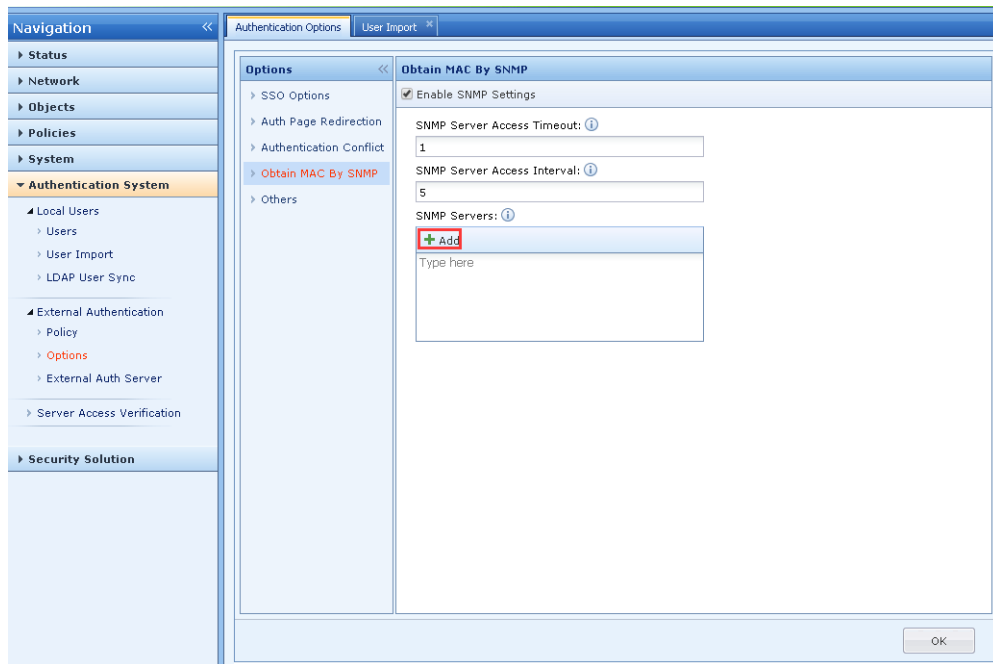

2. If there are more users, you can export a table and edit the table according to the format. As shown below:

3. Go to **Authentication System > External Authentication > Policy**, choose the Default policy and change the option of **New User Option** to **No authentication for new users**.

The screenshot shows the 'Authentication Policy' configuration window. The 'Description' is 'Default Policy' and the 'IP/MAC Range' is '0.0.0.0-255.255.255.255'. Under 'Server Type', 'SSO, Local or external password authentication' is selected. In the 'New User Option (for users outside local device)' section, the 'Added to specified local group' option is selected, but the 'No authentication for new users' radio button at the bottom is highlighted with a red box. Other options include 'Added as casual account' and 'User Sync Policy' settings.

5.3 Binding Mac When AF Connects to Layer 3 Switch

1. Configure SNMP on the Layer 3 switch. The protocol type choose all if possible. Get the oid value and community name of SNMP.
2. Go to **Authentication System > External Authentication > Options > Obtain MAC By SNMP** then click on the **Add** button to add the layer 3 switch IP as below:

3. After the configuration, test the user's real MAC address to test whether the user can access the Internet or not. If yes, refer to step 5.1 or 5.2. If unable to access internet might because of the Obtain MAC by SNMP failed.

6. Precautions

1. If the LAN users configured MAC address binding and NGAF is connected to layer 3 switch then it required to configure obtain MAC by SNMP on the NGAF.
2. If the user exists, automatic binding needs to delete the original user or manually re-bind it.
